AGENDA

- Arrays
- While
- For
- Break, continue
- Search item in the array
- Sorting
- Practical tasks

softserve

Array

An *array* is a container object that holds a fixed number of values of a single type. The length of an array is established when the array is created. After creation, its length is fixed.
```
String dayWeek[]= new String[7];

String[] month;

month = new String[12];
```

Each item in an array is called an *element*, and each element is accessed by its numerical *index*. As shown in the preceding illustration, numbering begins with 0.

```
dayWeek[0] = "Monday";

month[11] = "December";
```

serve

Array

```java
int month_days[ ]  = {31, 28, 31, 30, 31, 30,
                      31, 31, 30, 31, 30, 31} ;

int month_days[ ]  = new int[12];
month_days[0] = 31;
month_days[1] = 28;
// . . .
month_days[11] = 31;

int n = month_days.length;   // n = 12
System.out.println(month);   //[I@659e0bfd

Need override toString();
or use Arrays.toString(month);
```

softserve

Array

```
char twod1[ ][ ]= new char[3][4];
char[ ][ ] twod2= new char[3][4];
double m[ ][ ]=        {{0, 1, 2, 3},
       {4, 5, 6, 7},
       {8, 9, 10, 11},
       {12, 13, 14, 15}};
int twoD[ ][ ]= new int [4][ ];
twoD[0]= new int [1];
twoD[1]= new int [2];                    double m[4][4];      // Error;
twoD[2]= new int [3];
twoD[3]= new int [4];
int[ ][ ] irregular={{1},{2,3,4},{5},{6,7}}; // Rows not equal
```
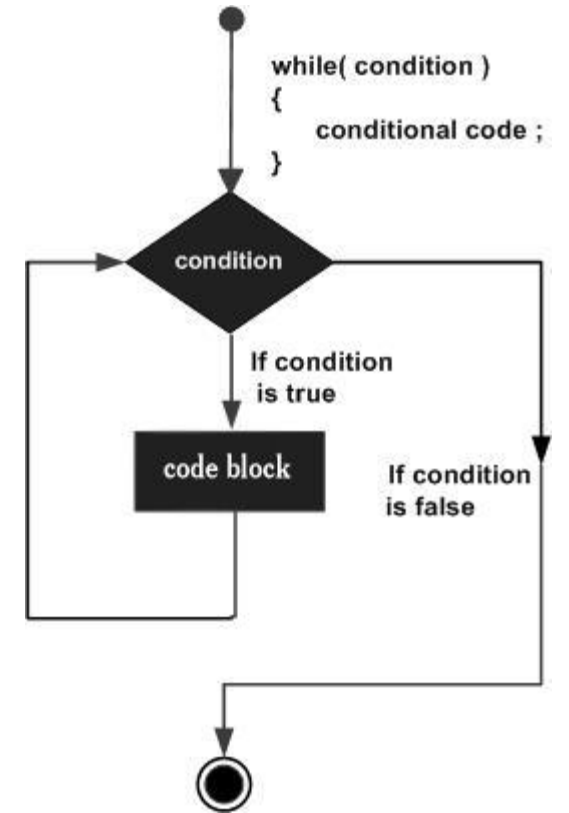

softserve

while

A **while** loop statement repeatedly executes a target statement as long as a given condition is true.

```
while (condition){
    statements;
}
```

What will be displayed?

```java
int number = 0;
while (number <= 5) {
    System.out.println(number);
    number++;
}
```

```
while( condition )
{
    conditional code ;
}
```

condition

If condition is true

code block

If condition is false

softserve

do while

The difference between **do-while** and **while** is that do-while evaluates its expression at the bottom of the loop instead of the top. Therefore, the statements within the do block are always executed at least once

```
do {
    statements;
} while (condition);
```

What will be displayed?

```
int i = 0;
do {
    System.out.print(++i);
} while (i < 5);
```

do {
    conditional code ;
} while (condition)

code block

If condition
is true

condition
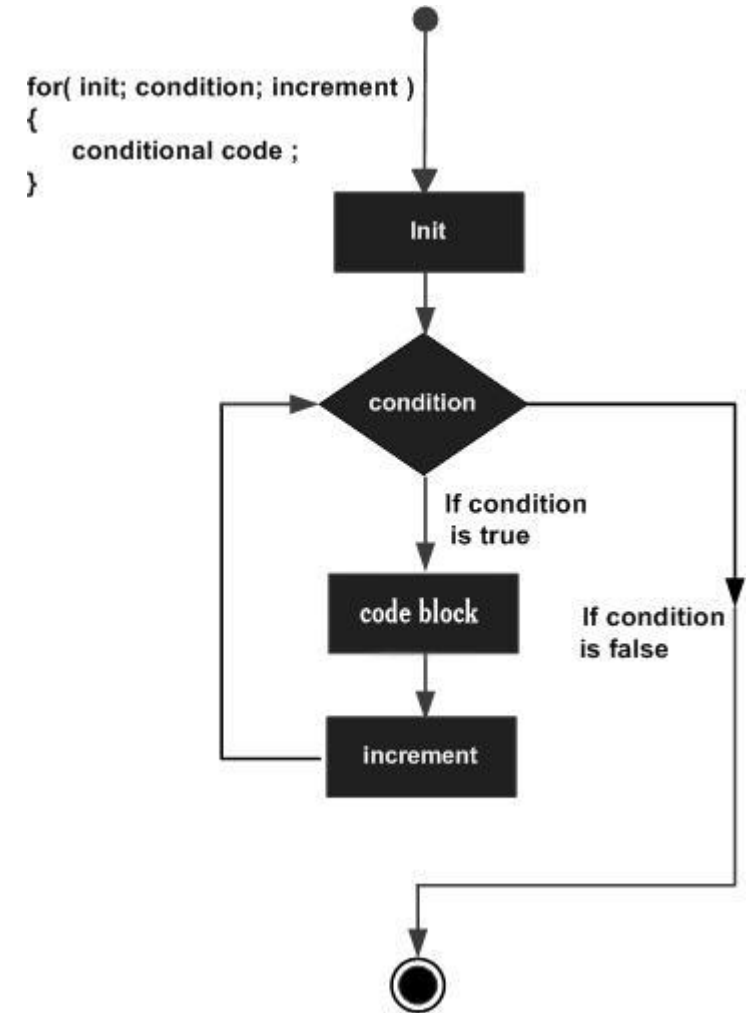

If condition
is false
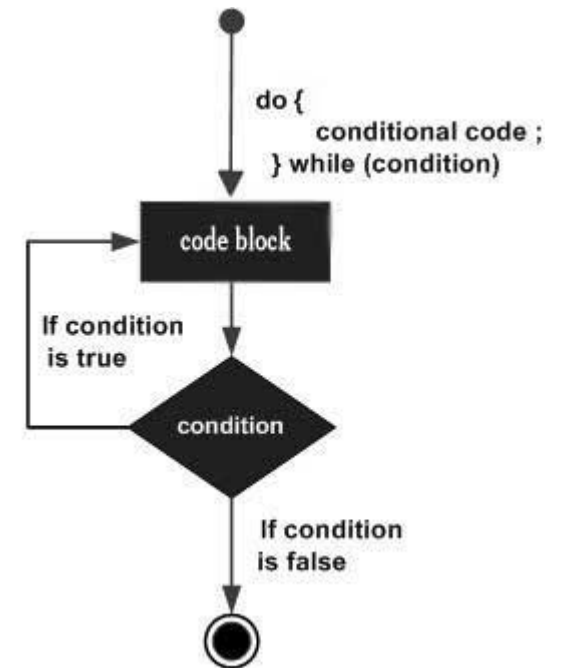

softserve

for

The **for** statement provides a compact way to iterate over a range of values.

```
for (init; condition ; increment) {
    statement(s);
}
```

What will be displayed?

```java
int[] month = {5, 6, 8, 3, 5, 7, 9};
for(int i = 0; i < month.length; i++){
    System.out.println(month[i]);
}
```

```
for( init; condition; increment )
{
    conditional code ;
}
```

Init

condition

If condition is true

code block

If condition is false

increment

softserve

for

Another representation of statement **for**

```
for (type variable : collection) {
    statement(s);
}
```

```java
int[] workHours = { 8, 6, 8, 7, 7 };

for (int h = 0; h < workHours.length; h++) {
    System.out.println(workHours[h]);
}

or

for (int h : workHours) {
    System.out.println(h);
}
```

softserve

break

The **break** statement terminates the for, while and do-while loop

What will be displayed?

```java
Scanner sc = new Scanner(System.in);
int n = 0;
for (int i = 0; i < 5; i++) {
    System.out.println("Input number");
    n = Integer.parseInt(sc.nextLine());
    if (n < 0){
        n = i;
        break;
    }
}
System.out.println(n);
sc.close();
```

softserve

continue

The **continue** statement skips the current iteration the **for**, **while** and **do-while** loop

What will be displayed?

```java
Scanner sc = new Scanner(System.in);
int sum = 0;
int n;
for (int i = 0; i < 5; i++) {
    System.out.println("Input number");
    n = Integer.parseInt(sc.nextLine());
    if (n < 0){
        n = i;
        continue;
    }
    sum += n;
}
System.out.println(sum);
sc.close();
```

Sum, product, amount

There's an array `int[] arr = {2, -5, 7, -4, 8};`

What will results after running next code?

```java
int sum = 0;
for (int i = 0; i < arr.length; i++) { sum += arr[i];}
System.out.println("Sum = " + sum);
```

```java
int product = 1;
for (int i = 0; i < 5; i++) {
        if (arr[i] > 0) {product = product * arr[i];}}
System.out.println("Product = " + product);
```

```java
int amount = 0;
for (int a : arr) {
        if (a > 0 && a <= 7) { amount++; }
}
System.out.println("Amount = " + amount);
```

Minimum, maximum …

There's an array `int[] arr = {2, -5, 7, -4, 8};`

What will results after running next code?

```java
int max = arr[0];
int imax = 0;
int i = 0;
while (i < arr.length) {
        if (arr[i] > max) {
                max = arr[i];
                imax = i;
        }
        i++;
}
System.out.print("Maximum = " + max);
System.out.println(" is in " + (imax + 1) + " place");
```

softserve

Sorting

There's an array `int[] arr = {2, -5, 7, -4, 8};`

What will results after running next code?

```java
int tmp;
for (int i = 0; i < arr.length - 1; i++) {
    for (int j = i + 1; j < arr.length; j++) {
        if (arr[i] < arr[j]) {
            tmp = arr[i];
            arr[i] = arr[j];
            arr[j] = tmp;
        }
    }
}
for (int i = 0; i < arr.length; i++) {
    System.out.println(arr[i]);
}
```

softserve

Practical tasks

1. Create an array of ten integers. Display

   - the biggest of these numbers;

   - the sum of positive numbers in the array;

   - the amount of negative numbers in the array.

   What values there are more: negative or positive?

2. Create a class *Employee* with fields *name, department number, salary*. Create five objects of class *Employee*. Display

   - all employees of a certain department (enter department number in the console);

   - arrange workers by the field *salary* in descending order.

Homework

1. Ask user to enter the number of month. Read the value and write the amount of days in this month (create array with amount days of each month).

2. Enter 10 integer numbers. Calculate the sum of first 5 elements if they are positive or product of last 5 element in the other case.

3. Enter 5 integer numbers. Find
   - position of second positive number;
   - minimum and its position in the array.

   Organize entering integers until the first negative number. Count the product of all entered even numbers.

1. Create class *Car* with fields type, year of production and engine capacity. Create and initialize four instances of class Car. Display cars
   - certain model year (enter year in the console);
   - ordered by the field year.
